# Development of Multi-Wavelength Spectral-Correction Method 

Hong Wen GAO<br>School of Chemistry and Chemical Engineering, Anhui University, Hefei 230039

#### Abstract

This investigation developed a new method for determining metal complex's property containing the stepwise real absorptivity $(\varepsilon)$ and stability constant $\left(K_{m}\right)$. The correction equation of the multi-wavelength spectral absorption was established for the simultaneous determination of various complexes to give high accuracy for trace analysis. This method was more acceptable in theory and simpler in operation than the classical methods.

Keywords: Simultaneous determination, multi-wavelength spectral-correction, complex property.

Beta-correction theory has been applied extensively for the analysis of metal complex solution ${ }^{1-3}$. Recently, we found that the beta-correction principle was very useful to the determination of metal complex's properties, for example the stepwise real absorptivity $(\varepsilon)$ and stability constant $\left(K_{m}\right)$. The new equations were established as follows:

$$
K_{m}=\frac{\gamma^{\prime}+1-m}{\left(m-\gamma^{\prime}\right)\left(C_{L i g a n d}-\gamma^{\prime} C_{M}\right)} \text { and } \varepsilon_{M L_{m}}=\frac{A_{c}}{\delta C_{M}\left(\gamma^{\prime}+1-m\right)}-\frac{m-\gamma^{\prime}}{\gamma^{\prime}+1-m} \varepsilon_{M L_{n-1}}
$$

where $A_{c}=\left(\Delta A-\beta \Delta A^{\prime}\right) /(1-\alpha \beta)$. The term, $A_{c}$ indicated the real absorbance of complex $\mathrm{ML}_{\gamma}\left(\alpha, \beta\right.$ and $\gamma$ were all constants), $\mathrm{C}_{\text {ligand }}$ and $\mathrm{C}_{\mathrm{M}}$ were the molarity of ligand and metal, respectively, $m$ indicated the $m$-th step complex and $\gamma$ the complexation ratio of ligand to metal. The new method was more acceptable in principle and simpler in operation than the ordinary methods such as molar ratio ${ }^{4}$, continuous variation ${ }^{5}$, equilibrium movement ${ }^{6}$, etc.

In addition, we studied the multi-reactions between various metals and single ligand. The following correction equation was established: $\sum_{j=1}^{n} a_{i j} x_{j}=\Delta A_{i}-\beta_{i} \Delta A_{0}^{\prime}(i=1,2, \ldots n)$ or the matrix expression: $\left(\begin{array}{cccc}a_{11} & a_{12} & \ldots & a_{1 n} \\ a_{21} & a_{22} & \ldots & a_{2 n} \\ \ldots & \ldots & \ldots & \ldots \\ a_{n 1} & a_{n 2} & \ldots & a_{n n}\end{array}\right)\left(\begin{array}{c}x_{1} \\ x_{2} \\ x_{n}\end{array}\right)=\left(\begin{array}{c}\Delta A_{1}-\beta_{1} \Delta A_{0}^{\prime} \\ \Delta A_{2}-\beta_{2} \Delta A_{0}^{\prime} \\ \ldots \ldots \ldots . . \ldots \ldots . . \\ \Delta A_{n}-\beta_{n} \Delta A_{0}^{\prime}\end{array}\right)$. Where $\beta_{i}=\varepsilon_{1 \text { i gand }}{ }^{\lambda i} / \varepsilon_{1 \text { i gand }}{ }^{\lambda 0}$ and $a_{i j}=A_{\beta i} / x_{j}$. The term $\beta_{i}$ was measured from L solution at wavelengths $\lambda_{i}$ and $\lambda_{0}$. The term $a_{i j}$ indicated the linear slope or sensitivity of $j$-th metal at $i$-th wavelength $\lambda_{i}$, which was regressed from the standard solutions. The corrected absorption eliminated the effect of other complexes and the excess of ligand in such a complicated system. This method brought out higher accuracy and better precision than the classical methods ${ }^{7,8}$ in the simultaneous determination of various trace components. The new reactions between ferrous, copper and new ligand dibromo-o-nitrophenylfluorone (DBNPF) were
investigated at pH 8 in detail. The absorption spectra were shown in Figure 1.
Figure 1 Absorption spectra of DBNPF and its Fe , Cu complex solutions: $0.70 \mu$ molDBNPF; 2Fe ( $8.0 \mu \mathrm{~mol}$ ) - DBNPF ( $0.70 \mu \mathrm{~mol}$ ) complex; 3-Cu( $8.0 \mu \mathrm{~mol})$-DBNPF ( $0.70 \mu \mathrm{~mol}$ ) complex; 4 - $\mathrm{Fe}(10.0 \mu \mathrm{~g})-\mathrm{Cu}(10.0 \mu \mathrm{~g})-\operatorname{DBNPF}(0.70 \mu \mathrm{~mol}) .4$ against a reagent blank and the others against water

The following calibration equation was established for the simultaneous determination of trace amounts of Fe between $0-5.00 \mu \mathrm{~g} / 25 \mathrm{ml}$ and Cu between $0-10.0 \mu \mathrm{~g} / 25 \mathrm{ml}$.
$\left(\begin{array}{ll}0.0188 & 0.0090 \\ 0.0252 & 0.0092\end{array}\right)\binom{x_{F e}}{x_{C u}}=\binom{\Delta A_{560 \mathrm{~nm}}-0.223 \Delta A_{480 \mathrm{~nm}}^{\prime}}{\Delta A_{580 \mathrm{~nm}}-0.053 \Delta A_{480 \mathrm{~nm}}^{\prime}}$
Table 1 gave out the determination results of stepwise stability constant ( $K_{j}$ ) and stepwise real molar absorptivity $\left(\varepsilon_{j}^{\lambda_{i}}\right)$ of $\mathrm{Fe}(\mathrm{j}=1)$ and $\mathrm{Cu}(\mathrm{j}=2)$ complexes

Table 1 the determination of stability constant and absorptivity of Fe and Cu complexes

| $j$-th step | $K_{j}\left(\right.$ in 0.025 ion strength and $\left.10^{\circ} \mathrm{C}\right)$ | $\varepsilon_{j}^{\lambda i}$ | $\mathrm{lmol}^{-1} \mathrm{~cm}^{-l}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{F e}(\mathbf{D B N P F})_{3}$ | $\mathbf{C u}(\mathbf{D B N P F})$ | $\mathbf{F e}(\mathbf{D B N P F})_{3}$ | $\mathbf{C u}(\mathbf{D B N P F})$ |
|  |  |  | at 580 nm | at 560 nm |
| 1 | $5.95 \times 10^{6}$ | $1.98 \times 10^{6}$ | $1.20 \times 10^{4}$ | $1.62 \times 10^{4}$ |
| 2 | $6.05 \times 10^{5}$ | $/$ | $2.45 \times 10^{4}$ | $/$ |
| 3 | $2.45 \times 10^{5}$ | $/$ | $3.67 \times 10^{4}$ | $/$ |
